Document Conversion Demonstration

This one-page document is a representative input for the OSCAR Docling service. It contains a title, sections, subsections, and ordinary explanatory text so that the generated Markdown can be inspected easily.

1. Purpose

The service converts documents with Docling's standard local pipeline and produces Markdown while preserving the document's logical structure. This example is intentionally short and self-contained.

1.1 Processing workflow

A document is submitted to the `input` path, processed by a worker, and written to the `output` path. The expected transformation is:

```
input.pdf -> input.md
```

1.2 Expected result

The resulting Markdown should contain the document title, all section headings, and this demonstration text. It should not require an external LLM or a remote inference service.

2. Example Content

Docling can analyse document layout, paragraphs, tables, and other supported structures. In a larger document, these elements would be converted into an equivalent Markdown representation for downstream search, analysis, or retrieval-augmented generation workflows.

2.1 Reproducibility

The service uses a pinned CPU image and a standard pipeline. Keeping the input small makes this document suitable for acceptance tests and local demonstrations.

3. Conclusion

This concludes the Docling demonstration document. A successful conversion should preserve the hierarchy from the title through the sections and subsections while producing readable Markdown output.
